

Problem №1:

loss f-n: $\text{loss}(\hat{\beta}) = (y - \hat{y})^T (y - \hat{y}) + \lambda \hat{\beta}^T \hat{\beta}$, $\hat{y} = \hat{\beta}_1 x + \hat{\beta}_2 x$
 $\lambda \geq 0$

a) $\hat{\beta}_1$ & $\hat{\beta}_2$ for fixed λ

as regressors x and x are identical \Rightarrow their contributions to \hat{y} are the same

$$\hat{y} = \hat{\beta}_1 x + \hat{\beta}_2 x = (\hat{\beta}_1 + \hat{\beta}_2) x = \beta x \Rightarrow$$

$$\Rightarrow \text{loss}(\beta) = \underbrace{(y - \beta x)^T (y - \beta x)}_{\text{how well model fits data}} + \underbrace{\lambda(\hat{\beta}_1^2 + \hat{\beta}_2^2)}_{\text{penalty term}}$$

$$\text{As } \hat{\beta}_1 + \hat{\beta}_2 = \beta \Rightarrow \hat{\beta}_1 = \hat{\beta}_2 = \frac{\beta}{2} \Rightarrow \hat{\beta}_1^2 + \hat{\beta}_2^2 = \left(\frac{\beta}{2}\right)^2 + \left(\frac{\beta}{2}\right)^2 = \frac{\beta^2 + \beta^2}{4} = \frac{2\beta^2}{4} = \frac{\beta^2}{2}$$

$$(y - \beta x)^T (y - \beta x) = y^T y - 2\beta y^T x + \beta^2 x^T x$$

$$\Rightarrow \text{loss}(\beta) = y^T y - 2\beta y^T x + \beta^2 x^T x + \lambda \frac{\beta^2}{2}$$

$$\text{min loss} \Rightarrow \text{take derivative } \text{loss}(\beta)'_{\beta} = 0$$

$$\text{loss}(\beta)'_{\beta} = -2y^T x + 2\beta x^T x + \lambda \beta = 0$$

$$\beta(2x^T x + \lambda) = 2y^T x$$

$$\boxed{\beta = \frac{2y^T x}{2x^T x + \lambda}}$$

$$\Rightarrow \boxed{\hat{\beta}_1 = \hat{\beta}_2 = \frac{\beta}{2} = \frac{y^T x}{2x^T x + \lambda}}$$

b) $\lambda \rightarrow \infty$

As $\uparrow \lambda \Rightarrow [\lambda(\hat{\beta}_1^2 + \hat{\beta}_2^2)] \uparrow \Rightarrow \hat{\beta}_1$ & $\hat{\beta}_2$ shrink to 0 to min penalty

$$\text{As } \hat{\beta}_1 = \hat{\beta}_2 = \frac{y^T x}{2x^T x + \lambda}$$

When $\lambda \rightarrow \infty \Rightarrow (2x^T x + \lambda) \rightarrow \infty \Rightarrow \hat{\beta}_1 \rightarrow 0$ & $\hat{\beta}_2 \rightarrow 0$

So, to avoid overfitting in ridge regression large λ hugely penalizes the coefficients

c) $\lambda \rightarrow 0$; $\hat{\beta}_1 + \hat{\beta}_2$ - ?

when $\lambda = 0 \Rightarrow$ regularization disappears \Rightarrow model reduces to OLS

$$\Rightarrow \hat{\beta}_1 + \hat{\beta}_2 = \beta = \frac{2y^T x}{2x^T x} = \frac{y^T x}{x^T x}$$

Problem N°2

$$y = X\beta + u$$

a) $E(\hat{\beta}|X)$ & $E(\hat{\beta})$ - ?

$$\hat{\beta} = (X^T X)^{-1} X^T y$$

$$\text{As } y = X\beta + u \Rightarrow \hat{\beta} = (X^T X)^{-1} X^T (X\beta + u) \Rightarrow$$

$$\Rightarrow \hat{\beta} = \underbrace{(X^T X)^{-1} X^T X}_{\substack{\text{identity} \\ \text{matrix (I)}}} \beta + (X^T X)^{-1} X^T u = \beta + (X^T X)^{-1} X^T u$$

$$\begin{aligned} 1) E(\hat{\beta}|X) &= E(\beta + (X^T X)^{-1} X^T u | X) = \underbrace{E(\beta | X)}_{\substack{\text{as } \beta \text{ non-random}}} + E((X^T X)^{-1} X^T u | X) = \\ &= \beta + (X^T X)^{-1} X^T \underbrace{E(u | X)}_0 = \beta + 0 = \beta \end{aligned}$$

$$\begin{aligned} 2) E(\hat{\beta}) &= E(\beta + (X^T X)^{-1} X^T u) \stackrel{\substack{\text{Tower} \\ \text{prop.}}}{=} E(\beta) + \underbrace{E((X^T X)^{-1} X^T u)}_0 = \\ &= \beta \end{aligned}$$

As $E(\hat{\beta}) = \beta \Rightarrow$ OLS is unbiased estimator of β

$$(b) \text{Var}(\hat{\beta} | x) = ?$$

$$\hat{\beta} = \overset{\text{non-random}}{\beta} + (X^T X)^{-1} X^T u \Rightarrow$$

$$\Rightarrow \text{Var}(\hat{\beta} | x) = \text{Var}((X^T X)^{-1} X^T u)$$

$$\text{As } u \sim N(0, \sigma^2 W) \Rightarrow \text{Var}(u | X) = \sigma^2 W$$

$$\text{Var}(\hat{\beta} | x) = (X^T X)^{-1} X^T (\sigma^2 W) X (X^T X)^{-1}$$

$$\text{As } (X^T X)^{-1} = ((X^T X)^{-1})^T \Rightarrow \text{Var}(\hat{\beta} | x) = \sigma^2 (X^T X)^{-1} X^T W X (X^T X)^{-1}$$

(c) Standard confidence interval assumes $\hat{\beta} \sim N(\beta, \sigma^2 (X^T X)^{-1})$

$\Rightarrow W = I$, but in this case $W \neq I$

From standard confidence intervals: $\text{Var}(\hat{\beta} | x) = \sigma^2 (X^T X)^{-1}$

$$\text{from (b): } \text{Var}(\hat{\beta} | x) = \sigma^2 (X^T X)^{-1} X^T \underline{W} X (X^T X)^{-1}$$

As $W \neq I \Rightarrow$ variance is not constant across observ.

\Rightarrow assumptions of st. confidence intervals are violated

Ignoring of W leads to misestimation of standard errors

of $\hat{\beta} \Rightarrow$ invalid F-tests & t-tests \Rightarrow as standard

confidence intervals rely on homoscedasticity ($W = I$)

they are not valid

$$(d) \text{Cov}(y, \hat{\beta} | x) = E[(y - \underbrace{E(y|x)}_{X\beta})(\hat{\beta} - \underbrace{E(\hat{\beta}|x)}_{\beta})^T | x]$$

$$\text{Cov}(y, \hat{\beta} | x) = E[\underbrace{(y - X\beta)}_{y = X\beta + u \Rightarrow u} (\hat{\beta} - \beta)^T | x] \Rightarrow$$

$$\Rightarrow \text{Cov}(y, \hat{\beta} | x) = E[u \cdot \underbrace{((X^T X)^{-1} X^T u)^T}_{u^T X (X^T X)^{-1}} | x] = E[u \cdot u^T \underbrace{X (X^T X)^{-1}}_{\text{not depend on } u} | x] =$$

$$= E(u \cdot u^T | x) \cdot X (X^T X)^{-1}$$

$$\text{Var}(u | x) = E(u \cdot u^T | x) = \sigma^2 W \Rightarrow \text{Cov}(y, \hat{\beta} | x) = \sigma^2 W X (X^T X)^{-1}$$

N3

As $X = \begin{pmatrix} 2 & 1 \\ -1 & 2 \\ 1 & 1 \end{pmatrix}$, then $X^T = \begin{pmatrix} 2 & -1 & 1 \\ 1 & 2 & 1 \end{pmatrix}$

$$XX^T = \begin{pmatrix} 2 & 1 \\ -1 & 2 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} 2 & -1 & 1 \\ 1 & 2 & 1 \end{pmatrix} = \begin{pmatrix} n_{11} & n_{12} & n_{13} \\ n_{21} & n_{22} & n_{23} \\ n_{31} & n_{32} & n_{33} \end{pmatrix} = \begin{pmatrix} 5 & 0 & 3 \\ 0 & 5 & 1 \\ 3 & 1 & 2 \end{pmatrix}$$

$$n_{11} = 2 \cdot 2 + 1 \cdot 1 = 5$$

$$n_{31} = 1 \cdot 2 + 1 \cdot 1 = 3$$

$$n_{12} = 2 \cdot (-1) + 1 \cdot 2 = 0$$

$$n_{32} = (-1) \cdot 1 + 2 \cdot 1 = 1$$

$$n_{13} = 2 \cdot 1 + 1 \cdot 1 = 3$$

$$n_{33} = 1 \cdot 1 + 1 \cdot 1 = 2$$

$$n_{21} = (-1) \cdot 2 + 2 \cdot 1 = 0$$

$$n_{22} = (-1) \cdot (-1) + 2 \cdot 2 = 4$$

$$n_{23} = (-1) \cdot 1 + 2 \cdot 1 = 1$$

$$X^T X = \begin{pmatrix} 2 & -1 & 1 \\ 1 & 2 & 1 \end{pmatrix} \begin{pmatrix} 2 & 1 \\ -1 & 2 \\ 1 & 1 \end{pmatrix} = \begin{pmatrix} n_{11} & n_{12} \\ n_{21} & n_{22} \end{pmatrix} = \begin{pmatrix} 6 & 1 \\ 1 & 6 \end{pmatrix}$$

$$n_{11} = (2 \cdot 2) + ((-1) \cdot (-1)) + (1 \cdot 1) = 6$$

$$n_{12} = (2 \cdot 1) + ((-1) \cdot 2) + (1 \cdot 1) = 1$$

$$n_{21} = (1 \cdot 2) + (2 \cdot (-1)) + (1 \cdot 1) = 1$$

$$n_{22} = (1 \cdot 1) + (2 \cdot 2) + (1 \cdot 1) = 6$$

Diagonalize $X^T X$:

• Eigenvalues:

$$\det(X^T X - \lambda I) = 0 \Rightarrow \det \begin{pmatrix} 6-\lambda & 1 \\ 1 & 6-\lambda \end{pmatrix} = 0$$

$$(6-\lambda)(6-\lambda) - 1 \cdot 1 = \lambda^2 - 12\lambda + 35 = 0$$

$$\Delta = 12^2 - 4 \cdot 35 = 144 - 140 = 4$$

$$\lambda = \frac{12 \pm 2}{2}$$

$$\begin{cases} \lambda = 7 \\ \lambda = 5 \end{cases} \Rightarrow D = \begin{pmatrix} 7 & 0 \\ 0 & 5 \end{pmatrix}$$

① for $\lambda = 7$: $(X^T X - 7 \cdot I) \cdot v = 0$

$$\begin{pmatrix} 6-7 & 1 \\ 1 & 6-7 \end{pmatrix} \cdot \begin{pmatrix} v_1 \\ v_2 \end{pmatrix} = 0 \Rightarrow \begin{pmatrix} -1 & 1 \\ 1 & -1 \end{pmatrix} \cdot \begin{pmatrix} v_1 \\ v_2 \end{pmatrix} = 0 \Rightarrow$$

$$\Rightarrow \begin{cases} v_1 - v_2 = 0 \\ -v_1 + v_2 = 0 \end{cases} \Rightarrow v_1 = v_2 \Rightarrow v = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$$

divide v by st. deviation $\Rightarrow v_n = \begin{pmatrix} 1/\sqrt{2} \\ 1/\sqrt{2} \end{pmatrix}$
to normalize

for $\lambda = 5$: $(X^T X - 5 \cdot I) \cdot v = 0$

$$\begin{pmatrix} 6-5 & 1 \\ 1 & 6-5 \end{pmatrix} \cdot \begin{pmatrix} v_1 \\ v_2 \end{pmatrix} = 0 \Rightarrow \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} \cdot \begin{pmatrix} v_1 \\ v_2 \end{pmatrix} = 0 \Rightarrow$$

$$\Rightarrow \begin{cases} v_1 + v_2 = 0 \\ v_1 + v_2 = 0 \end{cases} \Rightarrow v_1 = -v_2 \Rightarrow v = \begin{pmatrix} -1 \\ 1 \end{pmatrix}$$

divide v by st. deviation $\Rightarrow v_n = \begin{pmatrix} -1/\sqrt{2} \\ 1/\sqrt{2} \end{pmatrix}$
to normalize

$$V = \begin{pmatrix} \frac{1}{\sqrt{2}} & \frac{-1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{pmatrix} \text{ where columns of } V \text{ are the normalized eigenvectors of } X^T X \Rightarrow$$

$$\Rightarrow V^T = \begin{pmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{-1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{pmatrix}$$

$$\text{Diagonalized } X^T X = V \cdot D \cdot V^T = \begin{pmatrix} 1/\sqrt{2} & -1/\sqrt{2} \\ 1/\sqrt{2} & 1/\sqrt{2} \end{pmatrix} \begin{pmatrix} 7 & 0 \\ 0 & 5 \end{pmatrix} \begin{pmatrix} 1/\sqrt{2} & 1/\sqrt{2} \\ -1/\sqrt{2} & 1/\sqrt{2} \end{pmatrix}$$

$$(b) \text{ SVD: } X = U \Sigma V^T \Rightarrow X^T X = (U \Sigma V^T)^T U \Sigma V^T = V \Sigma^T \underbrace{U^T U}_{\text{identity matrix}} \Sigma V^T = V \Sigma^T \Sigma V^T$$

$$X X^T = U \Sigma V^T V \Sigma^T U^T = U \Sigma \Sigma^T U^T$$

$$\text{AS } X X^T = \begin{pmatrix} 5 & 0 & 3 \\ 0 & 5 & 1 \\ 3 & 1 & 2 \end{pmatrix}$$

Analogically with (a):

$$\det(X X^T - \lambda I) = \det \begin{pmatrix} 5-\lambda & 0 & 3 \\ 0 & 5-\lambda & 1 \\ 3 & 1 & 2-\lambda \end{pmatrix} = 0$$

$$(5-\lambda) \begin{vmatrix} 5-\lambda & 1 \\ 1 & 2-\lambda \end{vmatrix} - 0 \cdot \begin{vmatrix} 0 & 1 \\ 3 & 2-\lambda \end{vmatrix} + 3 \cdot \begin{vmatrix} 0 & 5-\lambda \\ 3 & 1 \end{vmatrix} =$$

$$= (5-\lambda)(\lambda^2 - 7\lambda + 9) + 3(-15 + 3\lambda) = -\lambda^3 + 12\lambda^2 - 44\lambda + 45 - 45 + 9\lambda = \lambda^3 + 12\lambda^2 - 35\lambda = 0 \Rightarrow -\lambda(\lambda^2 - 12\lambda + 35) = 0$$

$$\Rightarrow \begin{cases} \lambda = 0 \\ \lambda^2 - 12\lambda + 35 = 0 \end{cases}$$

$$\Delta = (-12)^2 - 4 \cdot 35 = 144 - 140 = 4$$
